Web Systems and Technologies _ Prelim Period

1. C# and OOP Foundations

- After practicing sample codes and small exercises help me to learn it little by little because I was confused about how classes, objects, and inheritance actually worked together.

2. Applying OOP in ASP.NET Core MVC

- Knowing it helped me in MVC because I understood how to create and use classes for the models. It made organizing code in controllers easier since I could seperate responsibilities.

3. Understanding Class Relationships

- For example, a student and a Section. A student is associated with section because they are connected, but a student can change sections and a section can have many students.

4. Expectations vs. Reality

- My expectations in this subject was really hard, but in reality it takes time to learn it and I also find it interesting.

5. Current Confidence and Growth

- I will say that my confidence is around 5/10 because sometimes I doubt myself and scared.

6. Bottlenecks and Struggles

- I struggled sometimes with the MVC, how I start the code with it, but I handled it by checking the recorded video of our (Professor) Professor and learning it.

7. Expectations Moving Forward

- I hope to learn it more but also a bit worried about more complex concepts.
